ABSTRACT OF THE INVENTION

A net is adapted to stretch across the entire width of a garage doorway to cover a
vertical portion of the doorway. The net comprises an open weave web portion having a
closed weave border. Two brackets mounted one on each side of the doorway near the floor
include lugs spaced above the garage floor. Straps extend from the bottom and top portions
of the border toward the brackets and loop through the lugs and back onto themselves where
hook-and-loop fasteners secure them in place. One or more intermediate straps may extend
from each end of the net between the top and bottom straps to corresponding lugs. The
garage door freely passes in front of the net to close the doorway as normal.
